

Setting Up Email Notifications from Adaptec Storage Manager

Setting up Email Notifications is the best way to identify potential problems with you RAID health and prevent possible data loss. Setting it up is a simple task, simply double click the Adaptec Storage Manager Icon on your desktop to begin. If you are using an Open-E system then you must install ASM on a workstation system and connect to it using the Remote Menu. When prompted for a Username and Password it is the same as the Administrator login in Windows, Root in Linux, and Web Admin in Open-E.

Once you've selected the system as shown, click on Configure and then mouse over to Email Notifications.

In the SMTP Server Settings box, please enter the correct information for your Outgoing Mail Server along with any username and password that might be needed. Then click Add email recipient on the toolbar to enter the email addresses you want alerts sent to.

Now in the event of a problem, ASM will send you an email alert about what is going on. Taking advantage of this built-in feature is a smart step in protecting your data. If you would like more information, you can download a full copy of the ASM Manual from Adaptec at:
